

EDIT - feature request #10343

Full implementation for showing IUCN "distribution" data separately

06/02/2023 04:12 PM - Andreas Müller

Status:	New	Start date:	
Priority:	New	Due date:

Target version:	Release 5.44		
Severity:	normal		

Description

copied from [#10308](#) , this overlaps a lot or is a duplicate for [#10422](#)

In [#10308](#) a first implementation for showing IUCN data handled in distribution data on the dataportal was implemented. This included using the new taxon page DTO based webservices which separate "real" distribution data from IUCN "distribution" data.

Issues there:

- does not work for maps yet (if wanted we could provide a second map showing distribution information, needs discussion if this is a requirement at all)
- does often not make sence for the long form area representations which do not include states or show them only via hovering/tooltip. For these a separate representation is mostly redundant

Therefore the current implementation switched off hardcoded maps and long form area representation.

An advanced implementation may allow a second map and the creation of long form area representation for IUCN depending on portal settings.

Also it is necessary to make it possible that both are switched on if no "real" distribution data exist but only IUCN data. => According to [#10308](#) this is already implemented for long representations

Also one may think about merging the long form area represetation tooltip data showing the status information. This may include "real" distribution status together with IUCN status in the same or a neighboring tooltip. However, this requires that the 2 status are not displayed completely separate. E.g. we could have a common chapter. "Geographic information" which then shows 1 or 2 maps, the condensed distribution strings with the according feature label and then a common long form representation with both information merged.

This needs to be further discussed.

Also we need to think about possibilities for configuration. Best would be a configuration per feature as it exists for TextData and others. Currently it is a hardcoded configuration only for "distribution". However, also the per feature implementation must take into account that in some cases data from different features may be shown in a merged way or dependend on the existence of the other data.
