

EDIT - task #6512

document eu.etaxonomy.cdm.model.common.IIdentifiableEntity.generateTitle()

03/15/2017 01:06 PM - Andreas Kohlbecker

Status:	Worksforme	Start date:	
Priority:	New	Due date:

Target version:			
Severity:	normal		
Description			
The method <code>IdentifiableEntity.generateTitle()</code> is completely undocumented. For References I only get a citation string using <code>generateTitle()</code> not with <code>getTitleCache()</code> , what's the difference and why do I need to call <code>getTitleCache()</code> some some cdm types while I need to use <code>generateTitle()</code> for others?

Documentation added.

For References I only get a citation string using `generateTitle()` not with `getTitleCache()`

I can't see this. Generally `getTitleCache` returns the `titleCache`. This is either the protected `titleCache` or the precomputed `titleCache` or the `titleCache` computed with `generateTitle`. But it is up to the implementing classes if they require a recompute each time or only if data has obviously changed (e.g. `setXXX` or `addXXX` was called on the entity). If external objects have changed (e.g. the title of the author) the `titleCache` may not be refreshed. Can you give an example why you think behavior is different? And in which context you use it. Or just close the ticket if the given documentation is sufficient.
