Description

Registrations are naturally bundled into working sets by the Reference entity for the related publications.

A single publication can encompass several new names and typedesignations. For each of the names and typedesignations an individual identifier and thus a separate registration is needed.
For better user experience registrations forming a working set should be bundled in the UI in order to reduce redundancy in the visual appearance and in the users efforts to process through the registration workflow.

A Registration is indirectly associated with the publication Reference by the following paths along the object graph:

```
Registration -+---> name ---> nomenclaturalReference
              |
              +---> typeDesignations ---> citation
```

I think it is OK to collect the References using this relationships so that it is not needed to add a private Reference publication; field to the Registration class.
The purpose of this ticket is to let you know about the requirement to use the workingsets and to start the discussion if needed.

History

#1 - 03/15/2017 03:03 PM - Andreas Kohlbecker

- Description updated

- Status changed from New to Feedback

#2 - 03/16/2017 03:54 PM - Andreas Müller

- Project changed from EDIT to PhycoBank

- Category deleted (cdmlib)

- Status changed from Feedback to Rejected

- Assignee changed from Andreas Müller to Andreas Kohlbecker

- Priority changed from New to Highest

- Target version deleted (Unassigned CDM tickets)

I also don't think we need to have a persistent class here, therefore close the ticket as rejected
