<b>Severity:</b>	normal		

#### Description

- the controller method `exportGetExplanation()` which is mapped to `/dwca` returns an html page which will in future contain the documentation of the webservice. The documentation however is in general produced through swagger. Therefore this method seems to be a concurrent approach to produce webservice documentation. I advocate for removing this method and to add proper swagger annotations where needed.
- swagger annotations are at least need for all request parameters of the type `UuidList`. All these appear as `List<String>` in swagger, so the user does not know what to pass to the web service.
- Passing an invalid uuid as classification causes a *Error 400 Bad Request* with no further information on the cause, better error reporting is needed here
